Ex. $X_1, \dots, X_n \sim N(\mu, 1)$

$$\Theta_0 = \{\mu \leq 0\}, \quad \Theta_1 = \{\mu > 0\}$$

Test: reject H_0 if $\bar{X}_n > c$

$$R = \left\{ (x_1, \dots, x_n) : \frac{x_1 + \cdots + x_n}{n} > c \right\}$$

Q. what should I do to c to get a really small α-level?

$$\beta(\mu) = \mathbb{P}\left[\bar{X} > c \mid X_1 \dots, X_n \sim N(\mu, 1)\right]$$

$$= \mathbb{P}\left[\sqrt{n}(\bar{X} - \mu) > \sqrt{n}(c - \mu) \mid X_1, \dots, X_n \sim N(0,1)\right]$$

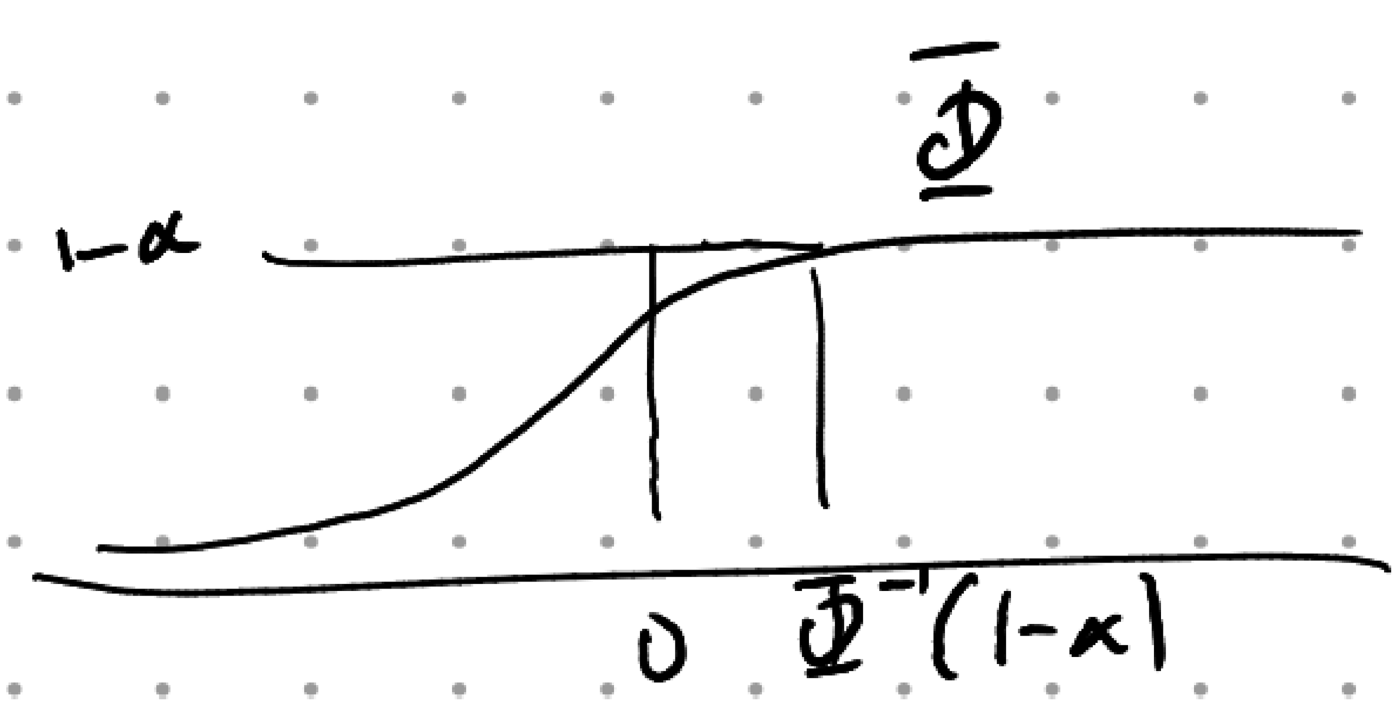
$$= \mathbb{P}\left[Z \geq \sqrt{n}(c - \mu) \mid Z \sim N(0,1)\right]$$

$$= 1 - \Phi\left(\sqrt{n}(c - \mu)\right)$$

$$\text{size} = \sup_{\mu \leq 0} \beta(\mu) = \beta(0) = 1 - \Phi(\sqrt{n} \cdot c)$$

β inc. in μ

level α if $c \geq \dfrac{\Phi^{-1}(1-\alpha)}{\sqrt{n}}$



Def. Suppose $\forall \alpha \in (0,1)$ we have a size α test with rejection region R_α

Then p-value $= \inf\{\alpha : (X_1, \dots, X_n) \in R_\alpha\}$,

Ex.

$$R_\alpha = \left\{ (x_1, \dots, x_n) : \frac{x_1 + \cdots + x_n}{n} > \frac{\Phi^{-1}(1-\alpha)}{\sqrt{n}} \right\}$$

$$p = \inf_\alpha : \frac{X_1 + \cdots + X_n}{n} > \frac{\Phi^{-1}(1-\alpha)}{\sqrt{n}}$$

$$= \alpha : \frac{X_1 + \cdots + X_n}{n} = \frac{\Phi^{-1}(1-\alpha)}{\sqrt{n}}$$

$$= 1 - \Phi\left(\sqrt{n}(\bar{X}_n)\right)$$
